

Composting Wet Waste

You can turn all your wet waste into a soil fertilizer without any hassle, smell or pests with one of the many composters that are available in Goa. And this can easily be done in your backyard or balcony!

How it works

You can make or buy your own composting unit. Bacterial Composting requires just three basics: air, moisture, and microbes. Luckily, all three are found naturally in your environment. Cowdung or Effective Microbes (EM) are excellent sources of good microbes. When properly treated, waste turns to compost in 45 to 90 days.

To get a **terracotta composter** or **EM**, simply contact [8087000708](tel:8087000708) (Panjim), [9527463684](tel:9527463684) (Margao) or [9766358343](tel:9766358343) (Porvorim/Vasco)

Get the Community Involved

Many hands make light work! Community Compost stations and Recycling Centers help manage larger volumes of waste within a community, be it a housing society, a ward or an entire village. Ask your local authority about setting up waste infrastructure and also start a composters subsidy scheme where you live.

**No more Tomorrow's,
Start Today!**
